

5.0 Loops and Iteration

Loops allow a program to repeat actions without writing the same code over and over. This topic covers the three loop types in Java and how to control them.

Learning Objectives

- Develop loop-based solutions using for, while, and do-while
- Control loop execution using break and continue
- Analyze loop efficiency and logic

Subtopics

for Loops

Counted repetition with a known number of iterations

while and do-while

Condition-based repetition

break and continue

Controlling loop execution mid-cycle
